Tula Company

San Jose, CA

Dear Hiring Manager,

I am eager to apply for Senior Embedded Software Engineer position, driven by my strong passion for modern technologies, particularly in the area of Advanced Vehicles.

I'm confident in my ability to support the development of these systems. For example, I enhanced the control system of Mexico City's electric train by programming in C with RTOS (Real Time Operative Systems) to calculate speed and flag events when it exceeded safe limits.

Additionally, I developed software for an ECU that controls the power components of the Ford Bronco and contributed to the AUDI inverter project. In these roles, I designed software based on the AUTOSAR architecture using tools like Vector DaVinci, and performed software testing via CAN and UDS protocols.

In these projects, I ensured 100% coverage of software requirements by developing and executing integration test cases with tools like Lauterbach, CANoe, and CANalyzer, while adhering to MISRA-C and Secure C standards to maintain security and reliability. My experience collaborating with global, cross-functional teams has also strengthened my communication and problem-solving skills, enabling me to effectively address customer needs.

Thank you for considering my application. I look forward to the opportunity to discuss how my skills and experience can contribute to the success of Tula Company.

Sincerely,

Ivonne Berenice Lemus Martínez.
